

```
1 Exploit strategy
2 In order to steal the flag, we have to make the response page depend on the ASCII code of the flag's
  first character. Then we do the same with the flag's second character, and so on. For example, the cut
  command can isolate a character from a file:
3 cut -b 1 flag
4 In addition, the printf command can convert such a character into a decimal number:
5 printf '%d' "'A"
6 See also the documentation of seq command, that may be useful.
